The positioning of the interface on the base must be carried out by a technically competent person who is knowledgeable in the setup of the wheel base and the Leckey product. We recommend a stability safety check is carried out to ensure the combined seat and wheelbase meet the requirements of ISO 7176 Part 1. Mount the interface centrally on the wheel base to ensure the product is stable when in use.

Before locating the Mobility Interface onto your Chassis Frame, please ensure you have all the parts below.

- Interface Frame  1 off
- Support Plate    1 off
- M8 Screws       4 off
- M8 Washers      8 off
- M8 Nylock Nuts  8 off

Locate the 2 rows of holes for securing the interface on the chassis. Selection of set of holes will depend on the desired position of the seat.

Fit the interface on top of the chassis with the closed end at the front. Fit the support plate on the under side of the chassis locating the same holes. Secure the interface and support plate using the screws and nuts supplied.
